[www.crennsmind.com](http://www.crennsmind.com)

# What's being covered?

---

- ▶ A Brief Warning
- ▶ Meet the GPIO (General Purpose Input/Output) Port
- ▶ Options for interacting with the GPIO
- ▶ Using a LED with the GPIO
- ▶ Using a port expander to drive LEDs instead
- ▶ Using a microcontroller to drive LEDs instead

# A Brief Warning

---

- ▶ It is possible to damage your Raspberry Pi:
  - ▶ The pins of the Raspberry Pi are 3.3V tolerant, anything higher will damage the pin and potentially cause the RPi to cease working completely
    - ▶ Use level convertors if needed or voltage dividers
  - ▶ Drawing too much current from the pins can also cause damage to the pins and potentially cause the RPi to cease working
    - ▶ Use transistors or external electronics to drive higher current loads
  - ▶ Drawing too much current from the voltage regulators may make the RPi unstable and unexpectedly reset
    - ▶ Limit the amount of current drawn from the RPi, use external power supplies

# Meet the GPIO Port!

---

- ▶ 17 GPIO
- ▶ 2 3.3V pins
- ▶ 2 5V pins
- ▶ 5 GND pins
- ▶ Many special functions available on the GPIO
  - ▶ SPI
  - ▶ I<sup>2</sup>C
  - ▶ UART
  - ▶ PWM

Information from:

[http://elinux.org/Rpi\\_Low-level\\_peripherals](http://elinux.org/Rpi_Low-level_peripherals)

---

# Options for interacting with the GPIO

---

## ▶ Hardware

- ▶ Floppy Drive Cables
- ▶ Breakout boards
  - ▶ Gertboard
  - ▶ PiFace
  - ▶ PiPlate
  - ▶ PiCrust
  - ▶ Cobbler
- ▶ Prototyping Wire
- ▶ Breadboards

# Options for interacting with the GPIO

---

- ▶ **Software**
  - ▶ WebIDE
  - ▶ Python
  - ▶ C/C++ Libraries
  - ▶ Scratch
  - ▶ Bash Scripts
  - ▶ Command Line

# Using an LED with the GPIO

---

- ▶ Nice simple example, using the GPIO to light an LED
- ▶ Using Python, just some prototyping wire and a breadboard
- ▶ Code base used from [http://elinux.org/Rpi\\_Low-level\\_peripherals](http://elinux.org/Rpi_Low-level_peripherals)

# Using an LED with the GPIO

---

```
import time
import RPi.GPIO as GPIO

# Setting library to using BCM GPIO 00..nn numbers GPIO.setmode(GPIO.BCM)
GPIO.setmode(GPIO.BCM)

# Setting the GPIO to an output
GPIO.setup(18, GPIO.OUT)

# Turning the GPIO On and Off 4 times
for x in range(0, 4):
    GPIO.output(18, True)
    time.sleep(1)
    GPIO.output(18, False)
    time.sleep(1)

# Return the GPIO to being an input
GPIO.setup(18, GPIO.IN)
```

# Using a port expander to drive LEDs

---

- ▶ Using an example utilising Adafruit's WebIDE
- ▶ The instructions are available here:  
<http://learn.adafruit.com/mcp230xx-gpio-expander-on-the-raspberry-pi/>
- ▶ Installation instructions for the WebIDE can be found here:  
<http://learn.adafruit.com/webide/installation>

# Using a microcontroller to drive LEDs

---

- ▶ Bit more complex as we need to communicate with the microcontroller, we'll use SPI
- ▶ Need to make a way of getting telling the Raspberry Pi to turn the LED on or OFF, we'll send a byte to the Microcontroller
- ▶ Using Mike's C library which supports SPI, available here:  
<http://www.open.com.au/mikem/bcm2835/>

---

Any questions?

I don't bite, I swear!
